4% PFA (paraformaldehyde)

-The Han Lab

- 1. Place 450 ml of dH2O in a glass beaker. Heat to 60 C using a hot plate with stirring.
- 2. While stirring, add 20 g of paraformaldehyde powder [Fisher #04042] to the heated water. Cover and maintain at 60 C.
- 3. Add 5 drops of 2N NaOH (1 drop per 100 ml). The solution should clear within a couple of minutes (There will be some fine particles that will not go away). Do not heat solution above 70 C. PFA will break down at temperatures above 70 C.
- 4. Remove from heat and add 50 ml of 10X PBS. Adjust pH to 7.2; you may have to add some HCl. Final volume will be 500 ml. Filter and place on ice. Cover with foil to protect from the light.
- 5. Use immediately, or aliquots may be frozen at -20 C and thawed as needed.

(The end)
